

Grade 8 Alaska Science Assessment Achievement Level Descriptors (ALDs)

The achievement level descriptors describe what a typical student scoring at each achievement level can do. A student who scores at a level would be expected to also be able to demonstrate the skills described in previous levels. A student would not necessarily demonstrate all the skills listed at a particular achievement level on a particular test in order to score at that level.

	Needs Support Student may partially meet the standards but needs support to master the knowledge and skills of current grade-level content.	Approaching Proficient Student partially meets the standards and may have gaps in knowledge and skills but is approaching mastery of some grade-level content.	Proficient Student meets the standards and demonstrates mastery of the knowledge and skills of most grade-level content.	Advanced Student meets the standards and demonstrates mastery of the knowledge and skills on a range of complex grade-level content.
<p>Life Science: <i>Students use science and engineering practices, crosscutting concepts, and an understanding of life science disciplinary core ideas to make sense of phenomena and solve problems.</i></p>	<p>A student at this level: can make observations to use as evidence that an object is a living or nonliving thing.</p> <p>can identify evidence supporting the claim that some animal behaviors can affect the survival of another species.</p> <p>can ask questions that could guide an investigation into the differences between how plants and animals obtain food.</p>	<p>A student at this level: can conduct an investigation to determine whether the existence of cells can be a distinguishing characteristic of living things.</p> <p>can use patterns to predict how a certain animal characteristic will likely affect the reproductive success of multiple other species.</p> <p>can use a scientific model to describe how food molecules are rearranged through chemical reactions to form new molecules and can show the cycling of matter and the flow of energy in an organism.</p>	<p>A student at this level: can conduct an investigation to provide evidence that tissues and organs are made of cells with specialized functions.</p> <p>can develop a model showing how characteristic behaviors, structures of organisms, human influence, and genetic and/or environmental factors can affect organisms' growth and reproductive success.</p> <p>can construct a scientific explanation based on evidence for the role of photosynthesis and chemical reactions with food molecules in the cycling of matter and flow of energy into and out of ecosystems.</p>	<p>A student at this level: can use arguments based on scientific reasoning and evidence from multiple sources to support the idea that a body is a system of interacting subsystems composed of specialized cells.</p> <p>can analyze the validity and reliability of given evidence to solve problems related to biological, genetic, and environmental factors affecting organisms.</p> <p>can develop a model to track the cycling of matter and flow of energy into, out of, and within the systems of a plant.</p>

	Needs Support Student may partially meet the standards but needs support to master the knowledge and skills of current grade-level content.	Approaching Proficient Student partially meets the standards and may have gaps in knowledge and skills but is approaching mastery of some grade-level content.	Proficient Student meets the standards and demonstrates mastery of the knowledge and skills of most grade-level content.	Advanced Student meets the standards and demonstrates mastery of the knowledge and skills on a range of complex grade-level content.
<p>Life Science: (cont)</p> <p><i>Students use science and engineering practices, crosscutting concepts, and an understanding of life science disciplinary core ideas to make sense of phenomena and solve problems.</i></p>	<p>A student at this level:</p> <p>can understand the process of sense receptors responding to stimuli.</p> <p>can describe how a change in resource availability can result in changes in a population of organisms.</p> <p>can make observations of biodiversity and ecosystem services.</p> <p>can identify examples of producers, consumers, and/or decomposers within an ecosystem and what effects they have in that system.</p>	<p>A student at this level:</p> <p>can construct an explanation, based on cause-and-effect evidence, of sensory receptors sending signals to the brain as a result of stimuli.</p> <p>can analyze and interpret patterns and make connections between resource availability and organism abundance.</p> <p>can identify patterns of biodiversity and ecosystem services.</p> <p>can complete a model of how matter and energy are transferred between producers, consumers, and decomposers within an ecosystem.</p>	<p>A student at this level:</p> <p>can develop and use a model to show sensory receptors responding to stimuli by sending messages to the brain for immediate behavior or storage as memories.</p> <p>can make sense of phenomena related to resource availability and patterns of interactions among organisms, organism abundance, and nonliving parts of an ecosystem.</p> <p>can explain relationships within ecosystems for maintaining biodiversity and ecosystem services.</p> <p>can construct an evidence-based argument describing the conservation of matter within and flow of energy into and out of an ecosystem.</p>	<p>A student at this level:</p> <p>can synthesize information that provides evidence of causal relationships between information received by sensory receptors and behavior, at various timescales.</p> <p>can use reasoning and evidence of interactions within an ecosystem to predict future interactions based on patterns.</p> <p>can evaluate competing design solutions for maintaining biodiversity and ecosystem services.</p> <p>can develop and use a model to explain the transfer of matter (atoms) and energy between living and nonliving parts of an ecosystem at various levels within the system.</p>

	Needs Support Student may partially meet the standards but needs support to master the knowledge and skills of current grade-level content.	Approaching Proficient Student partially meets the standards and may have gaps in knowledge and skills but is approaching mastery of some grade-level content.	Proficient Student meets the standards and demonstrates mastery of the knowledge and skills of most grade-level content.	Advanced Student meets the standards and demonstrates mastery of the knowledge and skills on a range of complex grade-level content.
Life Science: (cont) <i>Students use science and engineering practices, crosscutting concepts, and an understanding of life science disciplinary core ideas to make sense of phenomena and solve problems.</i>	<p>A student at this level:</p> <p>can recognize that structural changes to genes (i.e., mutations) may result in observable changes in organisms.</p> <p>can identify a similar anatomical feature shared by organisms that suggests they are likely to be more closely related than other organisms that do not share the similar anatomical feature.</p> <p>can recognize that some organisms have traits that will make them better able to survive and reproduce in a specific environment.</p>	<p>A student at this level:</p> <p>can use a model (e.g., Punnett square) to show that more genetic variation occurs in organisms that reproduce sexually compared to organisms that reproduce asexually.</p> <p>can construct an argument based on evidence that some organisms share a pattern of anatomical features that make them more likely to be related through evolution.</p> <p>can use evidence to show that some traits have advantages that make it more probable that an organism will be able to survive and reproduce in a specific environment.</p>	<p>A student at this level:</p> <p>can use evidence related to a phenomenon to predict the differences in genetic variation (including the effects of mutation) resulting from sexual and asexual reproduction.</p> <p>can apply scientific ideas and evidence to construct an explanation for the anatomical similarities and differences between modern and/or fossilized organisms that describes evolution over time.</p> <p>can evaluate different evidence-based explanations about genetic variation and natural selection within a population of organisms to determine the probability of survival and reproduction in a specific environment.</p>	<p>A student at this level:</p> <p>can use a model of a protein to explain how changes to protein structure (as a result of a mutation or mutations) can lead to changes in its function that may cause beneficial, neutral, or harmful changes in the structures or functions of organisms.</p> <p>can connect multiple sources of evidence comparing organisms, both modern and fossilized, to support an argument for evolution.</p> <p>can analyze data to trace patterns of particular traits in a population over time and make claims about how changes were likely the result of particular historical phenomena that changed their environment.</p>

	Needs Support Student may partially meet the standards but needs support to master the knowledge and skills of current grade-level content.	Approaching Proficient Student partially meets the standards and may have gaps in knowledge and skills but is approaching mastery of some grade-level content.	Proficient Student meets the standards and demonstrates mastery of the knowledge and skills of most grade-level content.	Advanced Student meets the standards and demonstrates mastery of the knowledge and skills on a range of complex grade-level content.
<p>Physical Science: <i>Students use science and engineering practices, crosscutting concepts, and an understanding of physical science disciplinary core ideas to make sense of phenomena and solve problems.</i></p>	<p>A student at this level: can use simple models of different atoms and molecules as support for why different substances have different properties.</p> <p>can make sense of a phenomenon where a collision occurs by describing how a force was exerted by one object on another object.</p> <p>can use information from a model to recognize that an object subjected to balanced forces does not change its motion and that an object subjected to unbalanced forces does change its motion.</p> <p>can identify the relative magnitude and direction of the forces between objects in a given system.</p>	<p>A student at this level: can plan experiments to identify different substances based on their characteristic physical properties (e.g., density, melting point) and recognize that the total number of atoms does not change.</p> <p>can use evidence to model the components within a system that are involved in a collision between two objects.</p> <p>can use mathematical thinking to explain how changes in an object's motion can be due to the degree of balanced or unbalanced forces acting on the object as well as the mass of the object.</p> <p>can identify evidence from a given phenomenon to support the idea that gravitational forces are attractive and mass dependent.</p>	<p>A student at this level: can analyze data to identify changes in the physical and chemical properties of substances before and after an interaction to make a claim about whether a chemical reaction occurred and to show that the total number of atoms has not changed.</p> <p>can address a given problem involving a collision of two objects by applying Newton's third law to detail a process or system that helps solve the problem.</p> <p>can conduct an investigation involving the change in motion of an object and gather evidence identifying various factors affecting the object's motion (emphasis on Newton's first and second laws).</p> <p>can construct an argument based on evidence that gravitational interactions are attractive and dependent on the masses of the interacting objects.</p>	<p>A student at this level: can use simple models to provide evidence for an argument that a change in the properties of substances can be related to the rearrangement of atoms in a chemical reaction.</p> <p>can evaluate data on two designs for solving a problem involving a collision of two objects to determine which design better meets the criteria and constraints of the situation.</p> <p>can plan an investigation to provide evidence that the change in an object's motion depends on specific variables, such as the initial motion of the object, the total forces acting on the object, and the mass of the object.</p> <p>can evaluate evidence on how well it supports the idea that gravitational forces are attractive and mass dependent, identify strengths and weaknesses of the evidence, and include possible alternative interpretations of it.</p>

	Needs Support Student may partially meet the standards but needs support to master the knowledge and skills of current grade-level content.	Approaching Proficient Student partially meets the standards and may have gaps in knowledge and skills but is approaching mastery of some grade-level content.	Proficient Student meets the standards and demonstrates mastery of the knowledge and skills of most grade-level content.	Advanced Student meets the standards and demonstrates mastery of the knowledge and skills on a range of complex grade-level content.
<p>Physical Science: (cont)</p> <p><i>Students use science and engineering practices, crosscutting concepts, and an understanding of physical science disciplinary core ideas to make sense of phenomena and solve problems.</i></p>	<p>A student at this level:</p> <p>can recognize that energy increases if either the mass or the speed of an object increases and that energy decreases if either the mass or the speed of the object decreases.</p> <p>can identify when thermal energy is added to or removed from a system.</p> <p>can identify that the interactions of two objects at a distance can cause a transfer of energy between the objects.</p> <p>can identify examples of mechanical waves, which need to be transmitted through a medium.</p>	<p>A student at this level:</p> <p>can interpret graphical displays of data to describe the relationships of kinetic energy to the mass of an object and to the speed of an object.</p> <p>can use a model to explain when thermal energy is added to or removed from a system.</p> <p>can analyze and interpret data to provide evidence that as the relative position of two objects changes, the potential energy of the system changes (e.g., an object higher off the ground has more gravitational potential energy).</p> <p>can use mathematical representations to describe a simple model for waves (repeating pattern) that includes how the amplitude of a wave is related to the energy in a wave.</p>	<p>A student at this level:</p> <p>can construct graphical displays or other models to communicate the idea that the mass and speed of an object affect its kinetic energy.</p> <p>can use a model that predicts and/or describes when thermal energy is added to or removed from a system.</p> <p>can develop a model to describe that when the arrangement of objects interacting at a distance changes, different amounts of potential energy are stored in the system.</p> <p>can describe a simple model for waves (repeating pattern) that includes evidence for how the amplitude of a wave is related to the energy in a wave.</p>	<p>A student at this level:</p> <p>can design a solution to a problem identified by analyzing data from multiple sources that show the relationships of kinetic energy to the mass and speed of an object.</p> <p>can develop and use a model to show changes in the thermal energy in a system.</p> <p>can plan and conduct an investigation to make sense of a given phenomenon involving two objects interacting at a distance (electric, magnetic, or gravitational interactions).</p> <p>can develop a model to compare mechanical and electromagnetic waves and explain similarities and differences in how energy is transferred by each type of wave.</p>

Earth and Space Science: (cont) <i>Students use science and engineering practices, crosscutting concepts, and an understanding of earth and space science disciplinary core ideas to make sense of phenomena and solve problems.</i>	A student at this level: can organize given data on solar system objects (e.g., surface features, object layers) from various Earth- and space-based instruments to allow for analysis and interpretation. can describe how newer rock layers sit on top of older rock layers, allowing for a relative ordering in time of the formation of the layers (assuming no disturbance of the layers). can identify examples of how humans can positively and negatively impact the environment.	A student at this level: can use quantitative analyses to describe similarities and differences among solar system objects by describing features of those objects at different scales. can construct an explanation of how the fossil record can provide relative dates of change over time based on the appearance or disappearance of organisms (e.g., within fossil layers). can identify patterns through mapping the history of natural hazards in a region and understanding related geological forces.	A student at this level: can use patterns in given data at varying scales to make conclusions about the identifying characteristics of different categories of solar system objects (e.g., planets, meteoroids, asteroids, comets) based on their features, compositions, and locations within the solar system. can obtain, evaluate, and synthesize information about local geological features to use as evidence to construct an explanation about the relative order of events and relative ages of rock layers and the fossil record. can construct an explanation based on evidence for how the availability of natural resources, the occurrence of natural hazards, and changes in climate have been influenced by human activity in Alaska.	A student at this level: can describe how advances in solar system science have been made possible by improved engineering (e.g., knowledge of the evolution of the solar system from lunar exploration and space probes) and new developments in engineering made possible by advances in science (e.g., space-based telescopes using different wavelengths). can make sense of a major event in Earth's history by constructing an argument supported by evidence from specific changes in fossils and geologic features over time (e.g., volcanic eruptions, glaciations, asteroid impacts). can analyze and interpret data on natural hazards to forecast future catastrophic events and inform the development of technologies to mitigate their effects.

	Needs Support Student may partially meet the standards but needs support to master the knowledge and skills of current grade-level content.	Approaching Proficient Student partially meets the standards and may have gaps in knowledge and skills but is approaching mastery of some grade-level content.	Proficient Student meets the standards and demonstrates mastery of the knowledge and skills of most grade-level content.	Advanced Student meets the standards and demonstrates mastery of the knowledge and skills on a range of complex grade-level content.
Earth and Space Science: (cont) <i>Students use science and engineering practices, crosscutting concepts, and an understanding of earth and space science disciplinary core ideas to make sense of phenomena and solve problems.</i>	A student at this level: can describe how oceanic or atmospheric circulation determines regional climates.	A student at this level: can use a model to describe how the unequal heating and rotation of Earth causes patterns of either atmospheric circulation or oceanic circulation.	A student at this level: can develop and use a model to describe how the unequal heating and rotation of Earth causes patterns of oceanic and atmospheric circulation that determine regional climates.	A student at this level: can develop and use a model to describe how the same unequal heating and rotation of Earth that causes regional climates also causes global patterns in climates.
